MEDICAL
TRANSCRIPTION

SPEECH
RECOGNITION

SWE licensing and attractive pricing make it an easy first step into speech recognition.

Combines a typing application, a Front End speech application and Back End speech processing into a single workstation license.

Extensive help file and handy tutorials assist in getting "up to speed" quickly with the application.

Designed to be used by the dictating physician for Front End Dictation or by a medical transcriptionist to assist in daily productivity.

Fusion Voice, Text and Speech is an integrated healthcare platform for dictation, transcription, and speech recognition.

Fusion Text & Speech

Single Workstation Edition (SWE)

Now the power and time saving features of the Fusion Text and Speech Enterprise software are available in a single workstation license. Fusion Text and Speech Single Workstation Edition will process your dictation recordings through a medical speech engine to produce the transcribed document. A physician using the software can save transcription processing costs. A transcriptionist editor using this software can be more productive by 30% or more!

Expert Speech Recognition

This sophisticated technology uses "Language modeling," to recognize and differentiate among the millions of human utterances. This software "recognizes" the spoken or recorded words, converts them into text, and displays them on the screen using a specialized medical language model.

Front End (Interactive) Dictation

The Fusion Text and Speech SWE feature set includes real-time or interactive speech recognition. After brief initial training, the user can speak into a supported microphone to produce words on the screen. As corrections are made, this User Profile is updated and available to the entire application - Front End or Back End processing.

Back-End Dictation Processing

Popular with the Enterprise Edition of Fusion Speech, the SWE can accommodate processing of Fusion Voice recordings. Without the physicians cooperation or even knowledge, the user can process a Fusion Voice dictation through the speech engine for correction by a transcriptionist.
