⌁ Voice Solutions

Legal Dictation System

The Voice Solutions system is designed to handle the dictation needs of busy law firms that desire a complete and flexible solution. Featuring the latest in software capabilities, the turnkey server comes in a variety of configurations, from 4 to 24 telephone call-in ports, complete with network/internet dictation and transcription.

Attorneys and their assistants can access the system through a variety of methods, allowing the Voice Solutions system to be tailored to your needs. As the diagram below shows, some of these methods are: PC/network based dictation; direct-wired dictate and transcribe stations; call-in telephone lines and/or extensions; integration of digital portable recorders; and transcription via the network or internet.

With Voice Solutions, you can start with one or two digital portables and use our inexpensive iChannel Lite (transcribe software), then, as your needs grow, expand to a full fledged system, as shown below. See the back for more on iChannel Lite.

- PcDictate, Olympus portable and iChannel Lite -
The Perfect Low Cost Solution for Small to Medium Law Firms

Using PC Dictate is easy; just log into the computer application and start dictating. The familiar hand held microphone gives you control over your dictation from start to finish. What's the digital difference? When you start your next dictation, the first one is already on its way across the network to your assistant for immediate action. One-touch control buttons on the desktop station make choosing a new secretary, or saving a job for completion later, a breeze.

**PC Dictate Station**

Olympus DS-4000

When On-the-Go dictation is needed, the Olympus DS-4000 digital portable is easy and convenient to use. The hassle of having to carry around and give tapes to your secretary is a woe of the past. Simply plug your portable via USB to any networked PC and your dictation files are ready for transcription.

Shared dictation directory on your network server

Using a share on one of your local servers, you can provide a central directory to which all dictation is downloaded to and typed from. This allows numerous users to type from the same group of dictation, or should they desire, limit themselves to just one particular individual's dictation. A network solution allows the administrator to oversee routine backup of the dictation, as well as control security. Affordable, effective, and simple!

iChannel Lite is a software package that monitors the dictation directory on the network server and automatically notifies the user when new dictation arrives. A job browser, user-friendly interface, and the ability share work between various transcriptionists make it the perfect solution.
