Solution Overview

Dolbey provides dictation professionals with a comprehensive, scalable and reliable dictation and voice management system in Fusion Voice. Dictate, manage, speech recognize and transcribe using powerful software applications. With open architecture, digital portability, PC access, and network or Internet distribution of voice and data, you can take the next step toward better productivity.

Centralized Management

Easy-to-use dictation and transcription tools are essential to the dictation system user; however, workflow is essential to the entire organization. Fusion Voice delivers both flexibility and manageability to create peak performance in your dictation and transcription workflow.

A highly scalable application built upon a powerful MS/SQL database, Fusion Voice provides this central management through a secure, desktop application or optionally through a universally accessible browser-based application.

Flexible Dictation Input

Telephone Access: For those that desire simplicity, this system accommodates dialing from a touch-tone telephone and dictating from anywhere.

For more specialized needs:

Fusion Dictate: Turn your PC into a customizable dictation station that can easily integrate to 3rd party applications and display relevant data about your case, patient, or subject matter. Add optional barcode input for fast, accurate ID entry.

Fusion Download: "Walk and Talk" using a portable dictation device. This PC application will automatically encrypt, and deliver your dictations to the Fusion server; wherever it may be. Optional barcode scanners and speech recognition features make entry of unique IDs easy and accurate.

Fusion Voice is a Dolbey Product.

Seamless Transcription Output

The challenge of managing and performing transcription isn't always as easy as listening and typing. The software's rules-based routing system directs your dictations to the right person, in the right order, and tracks the entire event to provide smart and clean management details.

Telephone Transcribe Access: Use a dedicated transcribe station to access the system through a hard-wire or telephone line connection.

Fusion Player: Turn your PC and sound card into a state-of-the-art transcribe station that uses a network or Internet connection to access dictations.

Both transcription playback methods provide clear, digital audio with settings for volume, tone, and speed control.

Embedded Speech

Fusion Voice incorporates a very unique approach to integrate advanced speech recognition with traditional dictation technology.

Fusion Voice2Text: Route dictation recordings through an advanced speech recognition engine so that transcriptionists receive a document draft along with the voice dictation. Save time and money by reducing transcription effort.

Integrated Solution

Fusion Voice, Text and Speech

For healthcare applications, Dolbey makes available a highly integrated solution to manage dictation creation, document creation, electronic signature and enterprise-wide speech recognition. For more information about the Fusion Voice, Text and Speech integrated solution, please contact your representative.
